

OPTIDRIVE™ CP2

AC Variable Speed Drive 0.75kW - 250kW / 1HP - 350HP 200 - 480 Volt 1 & 3 Phase

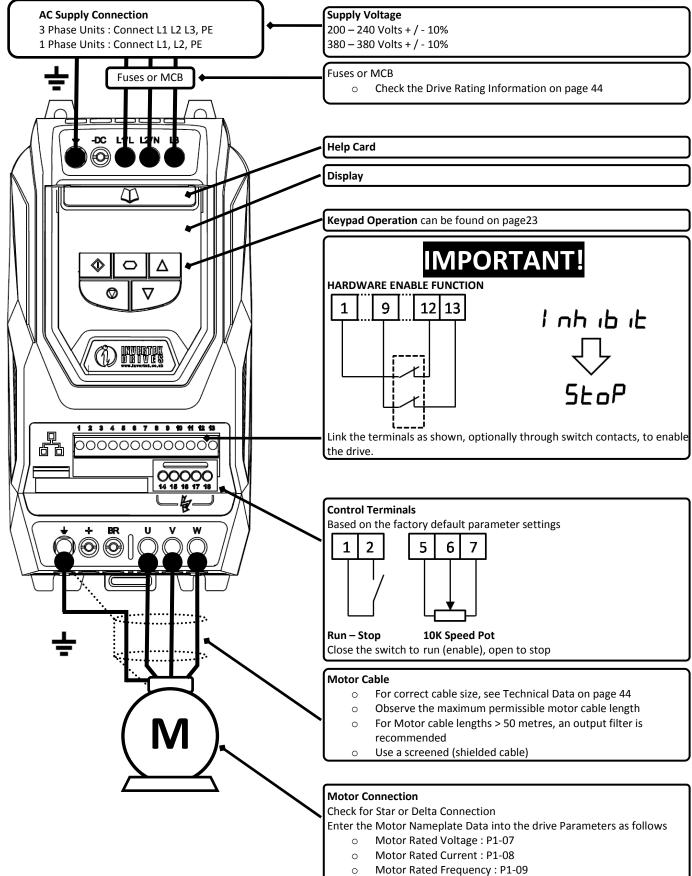

Installation & Operating Instructions

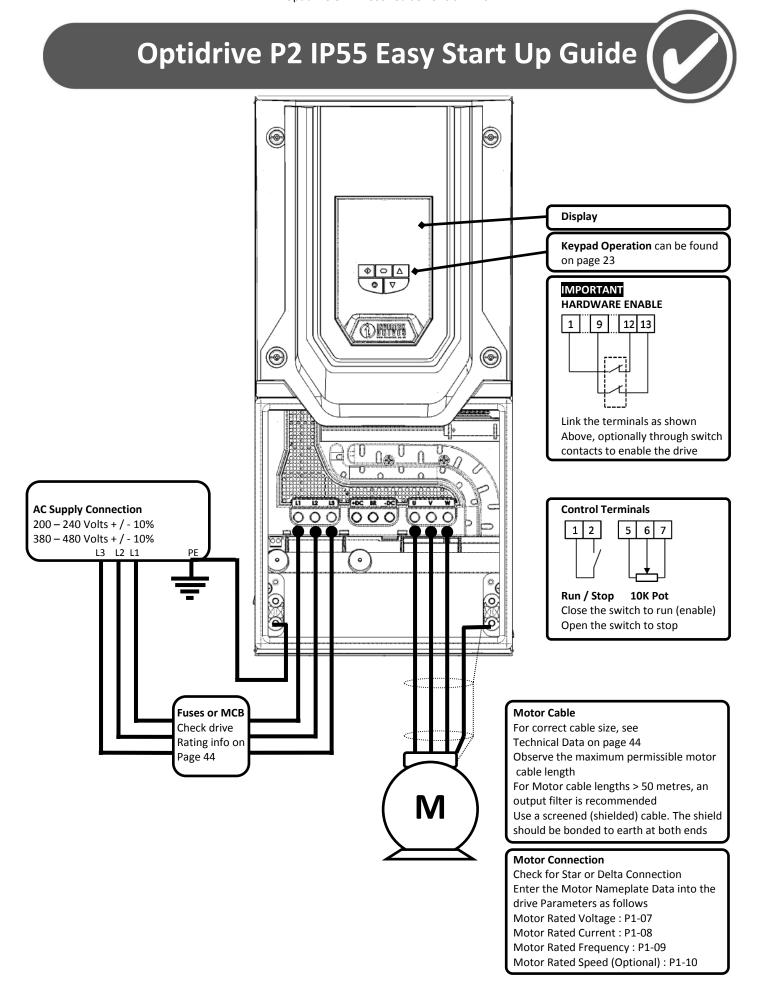

Optidrive P2 IP20 Easy Start Up Guide

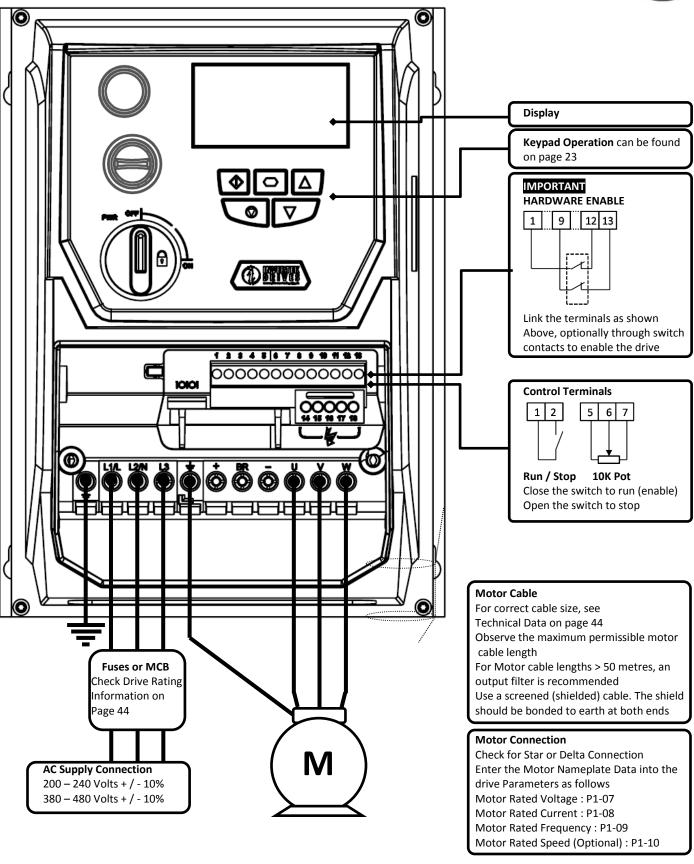

Motor Rated Speed (Optional): P1-10

Optidrive P2 IP66 Easy Start Up Guide

Declaration of Conformity:

Invertek Drives Ltd hereby states that the Optidrive ODP-2 product range conforms to the relevant safety provisions of the Low Voltage Directive 2006/95/EC and the EMC Directive 2004/108/EC and has been designed and manufactured in accordance with the following harmonised European standards:

EN 61800-5-1: 2003	Adjustable speed electrical power drive systems. Safety requirements. Electrical, thermal and energy.
EN 61800-3 2 nd Ed: 2004	Adjustable speed electrical power drive systems. EMC requirements and specific test methods
EN 55011: 2007	Limits and Methods of measurement of radio disturbance characteristics of industrial, scientific and medical (ISM) radio-frequency equipment (EMC)
EN60529 : 1992	Specifications for degrees of protection provided by enclosures

STO Function

Optidrive P2 incorporates a hardware STO (Safe Torque Off) Function, designed in accordance with the standards listed below.

Standard	Classification	Approval Status
IEC61608	SIL 2	Pending Certification
IEC 61800-5-2	Type 2	Pending Certification
IEC 62061	SIL 2	Pending Certification
ISO 13849	PL "d"	Pending Certification

Electromagnetic Compatibility

All Optidrives are designed with high standards of EMC in mind. All versions suitable for operation on Single Phase 230 volt and Three Phase 400 volt supplies and intended for use within the European Union are fitted with an internal EMC filter. This EMC filter is designed to reduce the conducted emissions back into the supply via the power cables for compliance with harmonised European standards.

It is the responsibility of the installer to ensure that the equipment or system into which the product is incorporated complies with the EMC legislation of the country of use. Within the European Union, equipment into which this product is incorporated must comply with the EMC Directive 2004/108/EC. When using an Optidrive with an internal or optional external filter, compliance with the following EMC Categories, as defined by EN61800-3:2004 can be achieved:

Prive Type / Rating	EMC Category							
	Cat C1	Cat C3						
Phase, 230 Volt Input	No additional filtering required	·						
DP-2-x2xxx-xxBxx	Use shielded motor cable							
	•							
Phase, 400 Volt Input	Use External Filter OD-Fx34x	No additional filtering required						
DP-2-x4xxx-xxAxx	Use screened motor cable							
		put dv / dt filter must be used, please refer to	the Invertek Stock Drives					
Note Catalogue for i	urther details nd Torque control modes may not operate correctly with long motor cables and output filters. It is recommended to							

operate in V/F mode only for cable lengths exceeding 50m

All Invertek Optidrive P2 units carry a 2 year warranty against manufacturing defects from the date of manufacture. The manufacturer accepts no liability for any damage caused during or resulting from transport, receipt of delivery, installation or commissioning. The manufacturer also accepts no liability for damage or consequences resulting from inappropriate, negligent or incorrect installation, incorrect adjustment of the operating parameters of the drive, incorrect matching of the drive to the motor, incorrect installation, unacceptable dust, moisture, corrosive substances, excessive vibration or ambient temperatures outside of the design specification.

The local distributor may offer different terms and conditions at their discretion, and in all cases concerning warranty, the local distributor should be contacted first.

The contents of this User Guide are believed to be correct at the time of printing. In the interest of a commitment to a policy of continuous improvement, the manufacturer reserves the right to change the specification of the product or its performance or the contents of the User Guide without notice.

This User Guide is for use with version 1.10 Firmware.

User Guide 1.11

Invertek Drives Ltd adopts a policy of continuous improvement and whilst every effort has been made to provide accurate and up to date information, the information contained in this User Guide should be used for guidance purposes only and does not form the part of any contract.

1. Introduction

1.1. Important safety information

Please read the IMPORTANT SAFETY INFORMATION below, and all Warning and Caution information elsewhere.

Danger: Indicates a risk of electric shock, which, if not avoided, could result in damage to the equipment and possible injury or death.

Danger: Indicates a potentially hazardous situation other than electrical, which if not avoided, could result in damage to property.

This variable speed drive product (Optidrive) is intended for professional incorporation into complete equipment or systems as part of a fixed installation. If installed incorrectly it may present a safety hazard. The Optidrive uses high voltages and currents, carries a high level of stored electrical energy, and is used to control mechanical plant that may cause injury. Close attention is required to system design and electrical installation to avoid hazards in either normal operation or in the event of equipment malfunction. Only qualified electricians are allowed to install and maintain this product.

System design, installation, commissioning and maintenance must be carried out only by personnel who have the necessary training and experience. They must carefully read this safety information and the instructions in this Guide and follow all information regarding transport, storage, installation and use of the Optidrive, including the specified environmental limitations.

Do not perform any flash test or voltage withstand test on the Optidrive. Any electrical measurements required should be carried out with the Optidrive disconnected.

Electric shock hazard! Disconnect and ISOLATE the Optidrive before attempting any work on it. High voltages are present at the terminals and within the drive for up to 10 minutes after disconnection of the electrical supply. Always ensure by using a suitable multimeter that no voltage is present on any drive power terminals prior to commencing any work.

Where supply to the drive is through a plug and socket connector, do not disconnect until 10 minutes have elapsed after turning off the supply.

Ensure correct earthing connections. The earth cable must be sufficient to carry the maximum supply fault current which normally will be limited by the fuses or MCB. Suitably rated fuses or MCB should be fitted in the mains supply to the drive, according to any local legislation or codes.

Do not carry out any work on the drive control cables whilst power is applied to the drive or to the external control circuits.

Within the European Union, all machinery in which this product is used must comply with Directive 98/37/EC, Safety of Machinery. In particular, the machine manufacturer is responsible for providing a main switch and ensuring the electrical equipment complies with EN60204-1.

The level of integrity offered by the Optidrive control input functions – for example stop/start, forward/reverse and maximum speed, is not sufficient for use in safety-critical applications without independent channels of protection. All applications where malfunction could cause injury or loss of life must be subject to a risk assessment and further protection provided where needed. The driven motor can start at power up if the enable input signal is present.

The STOP function does not remove potentially lethal high voltages. ISOLATE the drive and wait 10 minutes before starting any work on it. Never carry out any work on the Drive, Motor or Motor cable whilst the input power is still applied.

The Optidrive can be programmed to operate the driven motor at speeds above or below the speed achieved when connecting the motor directly to the mains supply. Obtain confirmation from the manufacturers of the motor and the driven machine about suitability for operation over the intended speed range prior to machine start up.

Do not activate the automatic fault reset function on any systems whereby this may cause a potentially dangerous situation.

The Optidrive ODP-2 has an Ingress Protection rating of IP20 or IP55 depending on the model. IP20 units must be installed in a suitable enclosure.

Optidrives are intended for indoor use only.

When mounting the drive, ensure that sufficient cooling is provided. Do not carry out drilling operations with the drive in place, dust and swarf from drilling may lead to damage.

The entry of conductive or flammable foreign bodies should be prevented. Flammable material should not be placed close to the drive

Relative humidity must be less than 95% (non-condensing).

Ensure that the supply voltage, frequency and no. of phases (1 or 3 phase) correspond to the rating of the Optidrive as delivered.

Never connect the mains power supply to the Output terminals U, V, W.

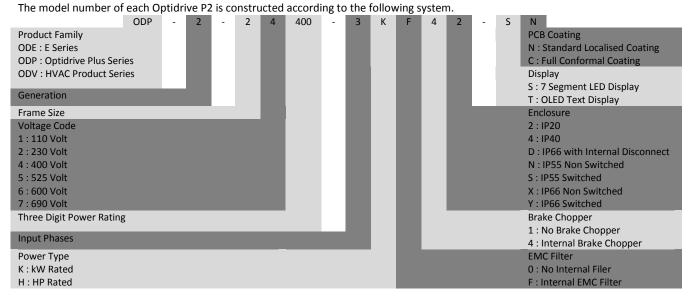

Do not install any type of automatic switchgear between the drive and the motor

Wherever control cabling is close to power cabling, maintain a minimum separation of 100 mm and arrange crossings at 90 degrees Ensure that all terminals are tightened to the appropriate torque setting

Do not attempt to carry out any repair of the Optidrive. In the case of suspected fault or malfunction, contact your local Invertek Drives Sales Partner for further assistance.

3. Mechanical Installation

3.1. General

- The Optidrive should be mounted in a vertical position only, on a flat, flame resistant, vibration free mounting using the integral mounting holes or DIN Rail clip (Frame Size 2 only).
- The Optidrive must be installed in a pollution degree 1 or 2 environment only.
- Do not mount flammable material close to the Optidrive
- Ensure that the minimum cooling air gaps, as detailed in section 0 and 3.7 are left clear
- Ensure that the ambient temperature range does not exceed the permissible limits for the Optidrive given in section 10.1
- · Provide suitable clean, moisture and contaminant free cooling air sufficient to fulfil the cooling requirements of the Optidrive

3.2. Before Installation

- Carefully Unpack the Optidrive and check for any signs of damage. Notify the shipper immediately if any exist.
- Check the drive rating label to ensure it is of the correct type and power requirements for the application.
- Store the Optidrive in its box until required. Storage should be clean and dry and within the temperature range -40°C to +60°C

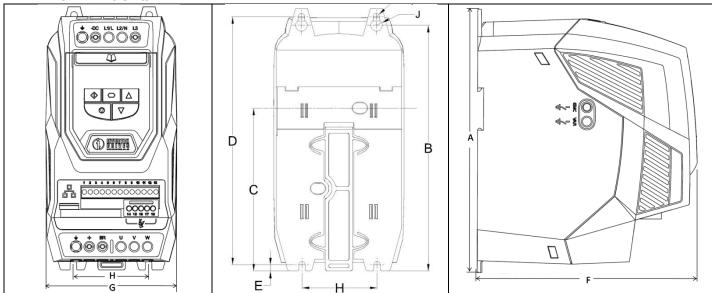

3.3. UL Compliant Installation

Note the following for UL-compliant installation:

- For an up to date list of UL compliant products, please refer to UL listing NMMS.E226333
- The drive can be operated within an ambient temperature range as stated in section 10.1
- For IP20 & IP40 units, installation is required in a pollution degree 1 environment
- For IP55 & IP66 units, installation in a pollution degree 2 environmant is permissible
- UL Listed ring terminals / lugs must be used for all bus bar and grounding connections

3.4. Mechanical dimensions

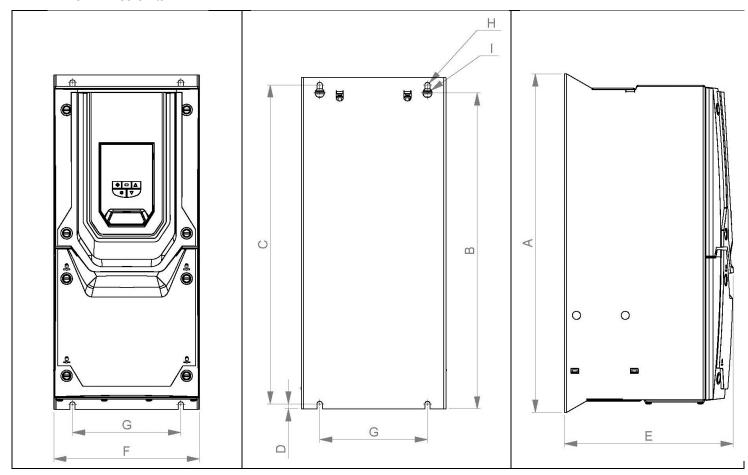

3.4.1. IP20 Units

3.5. Guidelines for Enclosure mounting (IP20 Units)

- Installation should be in a suitable enclosure, according to EN60529 or other relevant local codes or standards.
- Enclosures should be made from a thermally conductive material.
- Where vented enclosures are used, there should be venting above the drive and below the drive to ensure good air circulation see the diagram below. Air should be drawn in below the drive and expelled above the drive.
- In any environments where the conditions require it, the enclosure must be designed to protect the Optidrive against ingress of airborne dust, corrosive gases or liquids, conductive contaminants (such as condensation, carbon dust, and metallic particles) and sprays or splashing water from all directions.
- High moisture, salt or chemical content environments should use a suitably sealed (non-vented) enclosure.

The enclosure design and layout should ensure that the adequate ventilation paths and clearances are left to allow air to circulate through the drive heatsink. Invertek Drives recommend the following minimum sizes for drives mounted in non-ventilated metallic enclosures:-

Drive	!	Χ		Υ	Z		Recommended
Size		ve & low		her de	Between		airflow
	mm	in	mm	in	mm	in	CFM (ft ³ /min)
2	75	2.95	50	1.97	46	1.81	11
3	100	3.94	50	1.97	52	2.05	26

Note:

Dimension Z assumes that the drives are mounted side-byside with no clearance.

Typical drive heat losses are 3% of operating load conditions.

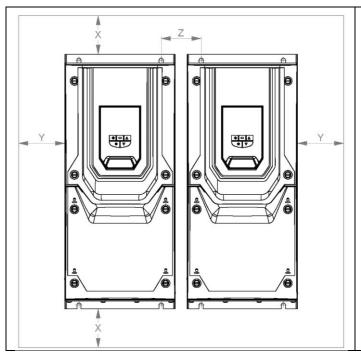

Above are guidelines only and the operating ambient temperature of the drive MUST be maintained at all times.

3.6. Mounting the Drive - IP20 Units

- IP20 Units are intended for installation within a control cabinet.
- When mounting with screws
 - O Using the drive as a template, or the dimensions shown above, mark the locations for drilling
 - o Ensure that when mounting locations are drilled, the dust from drilling does not enter the drive
 - o Mount the drive to the cabinet backplate using suitable M5 mounting screws
 - o Position the drive, and tighten the mounting screws securely
- When Din Rail Mounting (Frame Size 2 Only)
 - o Locate the DIN rail mounting slot on the rear of the drive onto the top of the DIN rail first
 - o Press the bottom of the drive onto the DIN rail until the lower clip attaches to the DIN rail
 - o If necessary, use a suitable flat blade screw driver to pull the DIN rail clip down to allow the drive to mount securely on the
 - To remove the drive from the DIN rail, use a suiatble flat blade screwdrive to pull the release tab downwards, and lift the bottom of the drive away from the rail first

3.7. Guidelines for mounting (IP55 Units)

- Before mounting the drive, ensure that the chosen location meets the environmental condition requirements for the drive shown in section 10.1
- The drive must be mounted vertically, on a suitable flat surface
- The minimum mounting clearances as shown in the table below must be observed
- · The mounting site and chosen mountings should be sufficient to support the weight of the drives

Drive)	Χ	Υ				
Size	Abo	ve &	Either				
	Bel	low	Side				
	mm	in	mm	in			
4	200	7.87	10	0.39			
5	200	7.87	10	0.39			
6	200	7.87	10	0.39			
7	200	7.87	10	0.39			

Note:

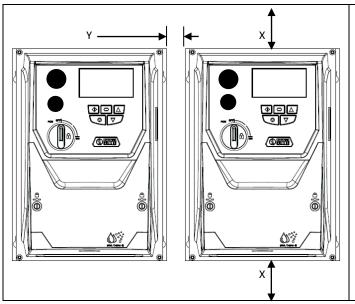

Typical drive heat losses are approximately 3% of operating load conditions.

Above are guidelines only and the operating ambient temperature of the drive MUST be maintained at all times.

- Using the drive as a template, or the dimensions shown above, mark the locations required for drilling
- The drive should be mounted using M8 (Frame Sizes 4 & 5) or M10 (Frame Sizes 6 & 7) mounting bolts

3.8. Guidelines for mounting (IP66 Units)

- Before mounting the drive, ensure that the chosen location meets the environmental condition requirements for the drive shown in section 10.1
- The drive must be mounted vertically, on a suitable flat surface
- The minimum mounting clearances as shown in the table below must be observed
- The mounting site and chosen mountings should be sufficient to support the weight of the drives

Drive)	X	Υ					
Size	Abo	ve &	Eith	er				
	Be	low	Side					
	mm	in	mm	in				
4	200	7.87	10	0.39				
5	200	7.87	10	0.39				
6	200	7.87	10	0.39				
7	200	7.87	10	0.39				

Note:

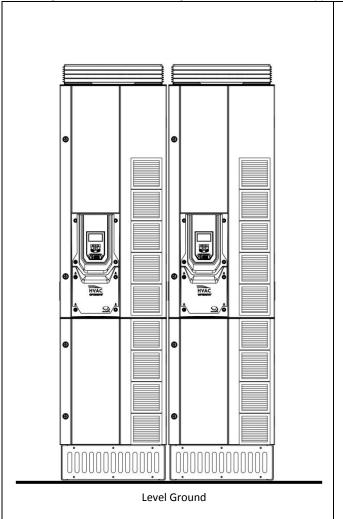

Typical drive heat losses are approximately 3% of operating load conditions.

Above are guidelines only and the operating ambient temperature of the drive MUST be maintained at all times.

- Using the drive as a template, or the dimensions shown above, mark the locations required for drilling
- The drive should be mounted using M8 (Frame Sizes 4 & 5) or M10 (Frame Sizes 6 & 7) mounting bolts

3.9. Guidelines for mounting (IP40 Units)

- Before mounting the drive, ensure that the chosen location meets the environmental condition requirements for the drive shown in section 10.1
- The drive must be floor standing, placed on a Horizontal and suitably flat surface
- The Enclosure must be anchored to an adjacent wall using the mounting points provided
- All Enclosure vents must remain clear with airflow unobstructed
- The mounting site and chosen mountings should be sufficient to support the weight of the drives

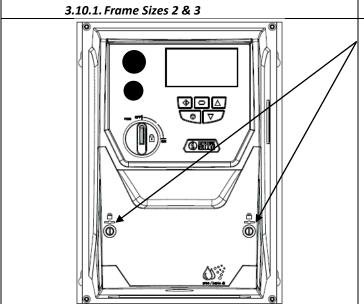

Note :

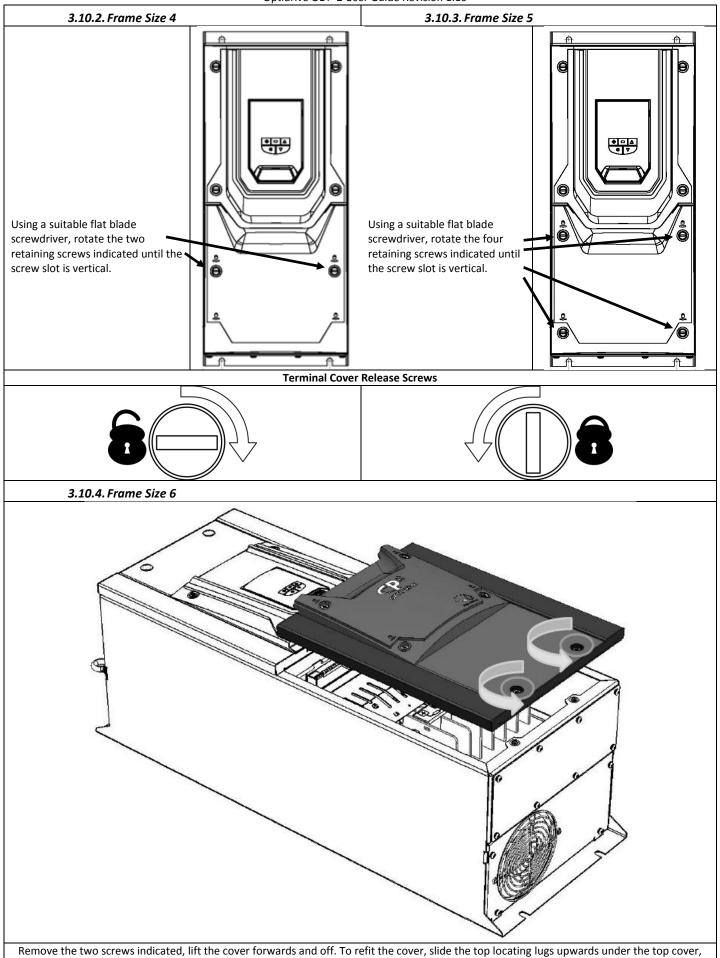

Typical drive heat losses are 3% of operating load conditions.

Above are guidelines only and the operating ambient temperature of the drive MUST be maintained at all times.

3.10. Removing the Terminal Cover

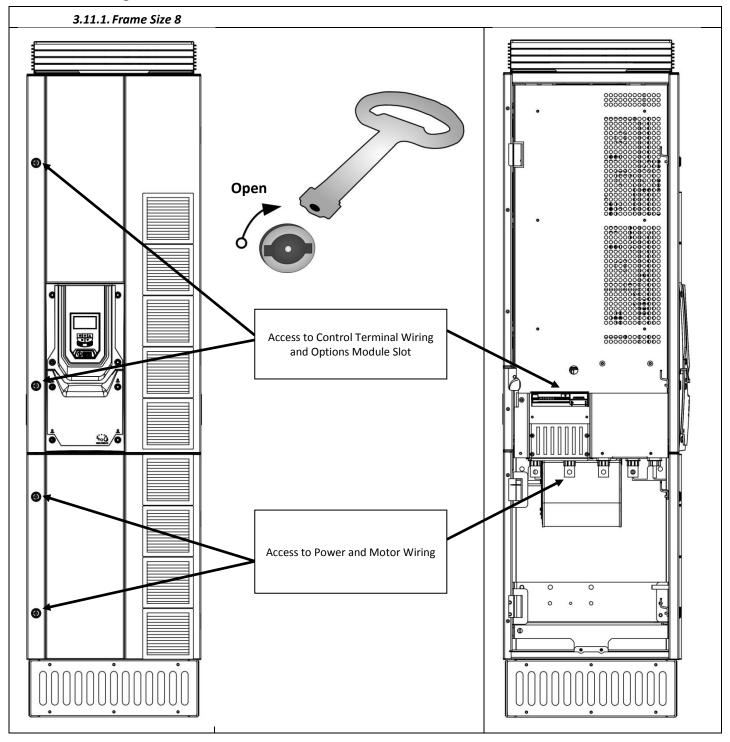

Using a suitable flat blade screwdriver, rotate the two retaining screws indicated until the screw slot is vertical.

then re-fasten the lower cover screws

3.11. Removing the Terminal Cover

4. Electrical Installation

4.1. Grounding the Drive

This manual is intended as a guide for proper installation. Invertek Drives Ltd cannot assume responsibility for the compliance or the non-compliance to any code, national, local or otherwise, for the proper installation of this drive or associated equipment. A hazard of personal injury and/or equipment damage exists if codes are ignored during installation.

This Optidrive contains high voltage capacitors that take time to discharge after removal of the main supply. Before working on the drive, ensure isolation of the main supply from line inputs. Wait ten (10) minutes for the capacitors to discharge to safe voltage levels. Failure to observe this precaution could result in severe bodily injury or loss of life.

Only qualified electrical personnel familiar with the construction and operation of this equipment and the hazards involved should install, adjust, operate, or service this equipment. Read and understand this manual and other applicable manuals in their entirety before proceeding. Failure to observe this precaution could result in severe bodily injury or loss of life.

4.1.1. Grounding Guidelines

The ground terminal of each Optidrive should be individually connected DIRECTLY to the site ground bus bar (through the filter if installed). Optidrive ground connections should not loop from one drive to another, or to, or from any other equipment. Ground loop impedance must confirm to local industrial safety regulations. To meet UL regulations, UL approved ring crimp terminals should be used for all ground wiring connections.

The drive Safety Ground must be connected to system ground. Ground impedance must conform to the requirements of national and local industrial safety regulations and/or electrical codes. The integrity of all ground connections should be checked periodically.

4.1.2. Protective Earth Conductor

The Cross sectional area of the PE Conductor must be at least equal to that of the incoming supply conductor.

4.1.3. Safety Ground

4.1.4. Motor Ground

The motor ground must be connected to one of the ground terminals on the drive.

4.1.5. Ground Fault Monitoring

As with all inverters, a leakage current to earth can exist. The Optidrive is designed to produce the minimum possible leakage current whilst complying with worldwide standards. The level of current is affected by motor cable length and type, the effective switching frequency, the earth connections used and the type of RFI filter installed. If an ELCB (Earth Leakage Circuit Breaker) is to be used, the following conditions apply:

- A Type B Device must be used
- The device must be suitable for protecting equipment with a DC component in the leakage current
- Individual ELCBs should be used for each Optidrive

4.1.6. Shield Termination (Cable Screen)

The safety ground terminal provides a grounding point for the motor cable shield. The motor cable shield connected to this terminal (drive end) should also be connected to the motor frame (motor end). Use a shield terminating or EMI clamp to connect the shield to the safety ground terminal.

4.2. Wiring Precautions

Connect the Optidrive according to section 4.3, ensuring that motor terminal box connections are correct. There are two connections in general: Star and Delta. It is essential to ensure that the motor is connected in accordance with the voltage at which it will be operated. For more information, refer to section 4.6 Motor Terminal Box Connections.

It is recommended that the power cabling should be 4-core PVC-insulated screened cable, laid in accordance with local industrial regulations and codes of practice.

4.3. Incoming Power Connection

- For 1 phase supply, power should be connected to L1/L, L2/N.
- For 3 phase supplies, power should be connected to L1, L2, and L3. Phase sequence is not important.
- For compliance with CE and C Tick EMC requirements, a symmetrical shielded cable is recommended.
- A fixed installation is required according to IEC61800-5-1 with a suitable disconnecting device installed between the Optidrive and the AC Power Source. The disconnecting device must conform to the local safety code / regulations (e.g. within Europe, EN60204-1, Safety of machinery).
- The cables should be dimensions according to any local codes or regulations. Guideline dimensions are given in section 10.2.
- Suitable fuses to provide wiring protection of the input power cable should be installed in the incoming supply line, according to the data in section 10.2. The fuses must comply with any local codes or regulations in place. In general, type gG (IEC 60269) or UL type T fuses are suitable; however in some cases type aR fuses may be required. The operating time of the fuses must be below 0.5 seconds.
- Where allowed by local regulations, suitably dimensioned type B MCB circuit breakers of equivalent rating may be utilised in place of fuses, providing that the clearing capacity is sufficient for the installation.
- When the power supply is removed from the drive, a minimum of 30 seconds should be allowed before re-applying the power. A
 minimum of 5 minutes should be allowed before removing the terminal covers or connection.
- The maximum permissible short circuit current at the Optidrive Power terminals as defined in IEC60439-1 is 100kA.

- An optional Input Choke is recommended to be installed in the supply line for drives where any of the following conditions occur:-
 - The incoming supply impedance is low or the fault level / short circuit current is high
 - o The supply is prone to dips or brown outs
 - An imbalance exists on the supply (3 phase drives)
 - o The power supply to the drive is via a busbar and brush gear system (typically overhead Cranes).
- In all other installations, an input choke is recommended to ensure protection of the drive against power supply faults. Part numbers are shown in the table.

Supply	Frame Size	AC Input Inductor
230 Volt	2	OD-IL221-IN
1 Phase	3	OD-IL321-IN
400 Volt	2	OD-IL-243-IN
3 Phase	3	OD-IL-343-IN

4.4. Operation of 3 Phase drives from a Single Phase Supply

A special function of Optidrive P2 allows all drives designed for operation on 3 phase supplies to be operated on a single phase supply of the correct rated voltage at up to 50% of the nominal capacity.

For Example, Model Number ODP-2-64450-3KA4N can be operated on a single phase supply, 380 – 480 volts, with the maximum output current limited to 45 Amps

The supply should be connected to the L1 and L2 terminals of the drive.

4.5. Drive and Motor Connection

- The motor should be connected to the Optidrive U, V, and W terminals using a suitable 3 or 4 core cable. Where a 3 core cable is utilised, with the shield operating as an earth conductor, the shield must have a cross sectional area at least equal to the phase conductors when they are made from the same material. Where a 4 core cable is utilised, the earth conductor must be of at least equal cross sectional area and manufactured from the same material as the phase conductors.
- The motor earth must be connected to one of the Optidrive earth terminals.
- For compliance with the European EMC directive, a suitable screened (shielded) cable should be used. Braided or twisted type screened cable where the screen covers at least 85% of the cable surface area, designed with low impedance to HF signals are recommended as a minimum. Installation within a suitable steel or copper tube is generally also acceptable.
- The cable screen should be terminated at the motor end using an EMC type gland allowing connection to the motor body through the largest possible surface area
- Where drives are mounted in a steel control panel enclosure, the cable screen may be terminated directly to the control panel using a suitable EMC clamp or gland, as close to the drive as possible.
- For IP55 drives, connect the motor cable screen to the internal ground clamp

4.6. Motor Terminal Box Connections

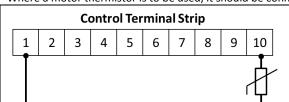

Most general purpose motors are wound for operation on dual voltage supplies. This is indicated on the nameplate of the motor

This operational voltage is normally selected when installing the motor by selecting either STAR or DELTA connection. STAR always gives the higher of the two voltage ratings.

Incoming Supply Voltage	Motor Nameplate Voltages	Connection	
230	230 / 400	DELTA A	
400	400 / 690	Delta O O O O V W	
400	230 / 400	Star Star Star Star Star Star Star Star	

4.7. Motor Thermistor Connection

Where a motor thermistor is to be used, it should be connected as follows:-

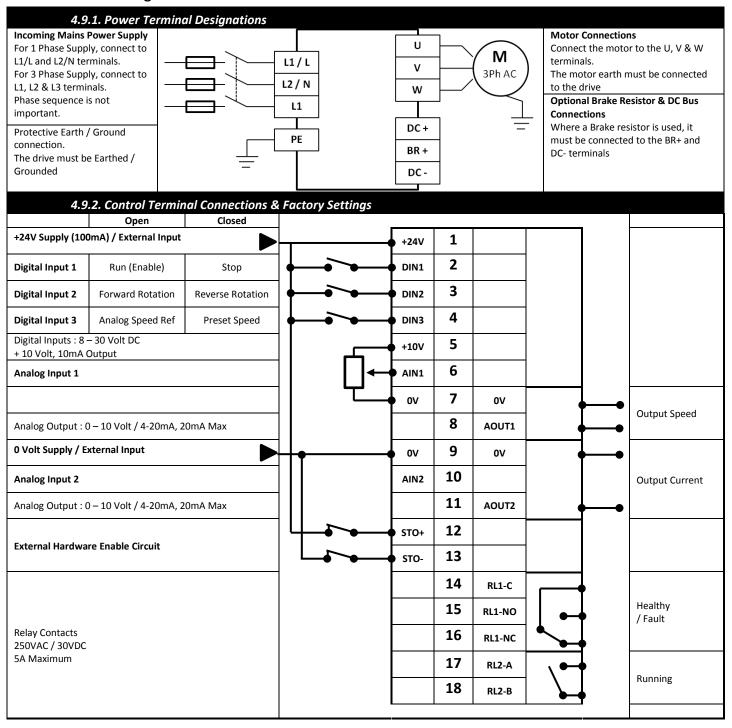

Additional Information

- ullet Compatible Thermistor : PTC Type, 2.5k Ω trip level
- Use a setting of P1-13 that has Input 5 function as External Trip, e.g. P1-13 = 6. Refer to section 7 for further details.

4.8. Control Terminal Wiring

- All analog signal cables should be suitably shielded. Twisted pair cables are recommended.
- · Power and Control Signal cables should be routed separately where possible, and must not be routed parallel to each other
- Signal levels of different voltages e.g. 24 Volt DC and 110 Volt AC, should not be routed in the same cable.
- Maximum control terminal tightening torque is 0.5Nm

4.9. Connection Diagram

5. Managing the Keypad

The drive is configured and its operation monitored via the keypad and display.

5.1. Keypad Layout and Function – Standard LED Keypad

	NAVIGATE	Used to display real-time information, to access and exit parameter edit mode and to store parameter changes	
	UP	Used to increase speed in real-time mode or to increase parameter values in parameter edit mode	
	DOWN	Used to decrease speed in real-time mode or to decrease parameter values in parameter edit mode	
	RESET / STOP	Used to reset a tripped drive. When in Keypad mode is used to Stop a running drive.	(D) DRIVES
\Diamond	START	When in keypad mode, used to Start a stopped drive or to reverse the direction of rotation if bi-directional keypad mode is enabled	

5.2. Changing Parameters

5121 Griding Farameters	
Procedure	Display shows
Power on Drive	StoP
Press and hold the for >2 seconds	P I- 0 I
Press the Key	P I-02
The and can be used to select the desired parameter	P I- 03 etc
Select the required parameter, e.g. P1-02	P I-02
Press the button	0.0
Use the and keys to adjust the value, e.g. set to 10	10.0
Press the key	P I-02
The parameter value is now adjusted and automatically stored. Press the operating mode	StoP

5.3. Advanced Keypad Operation Short Cuts

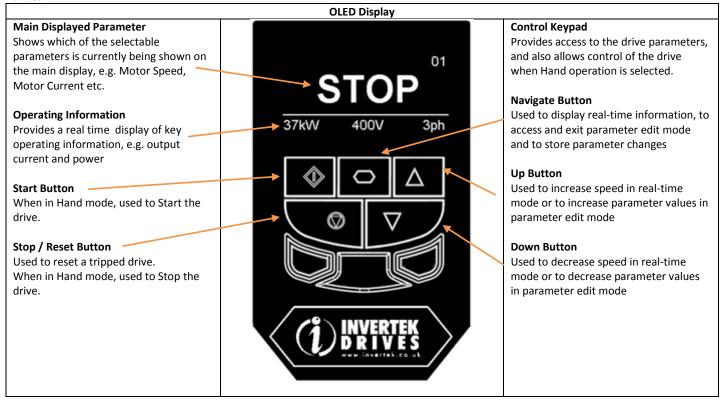

Function	When Display shows	Press	Result	Example
Fast Selection of Parameter Groups Note : Parameter Group	P x-xx	D + D	The next highest Parameter group is selected	Display shows P 1- 10 Press + Display shows P2-0 1
Access must be enabled P1-14 = 101	P x-xx	D + D	The next lowest Parameter group is selected	Display shows P2-26 Press + V Display shows P I-0 I
Select lowest Group Parameter	P x-xx	1 + 1	The first parameter of a group is selected	Display shows P - 10 Press + V
Set Parameter to minimum value	Any numerical value (Whilst editing a parameter value)	\D + \D	The parameter is set to the minimum value	When editing P1-01 Display shows 50.0 Press + V Display shows 0.0
Adjusting individual digits within a parameter value	Any numerical value (Whilst editing a parameter value)	+	Individual parameter digits can be adjusted	When editing P1-10 Display shows Press Display shows Display shows Display shows Press Display shows Displ

5.4. Drive Operating Displays

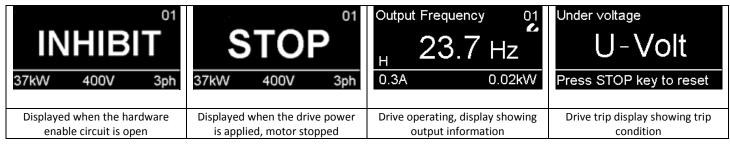

Display	Status	
StoP	Drive mains power applied, but no Enable or Run signal applie	d
AULo-L	Motor Autotune in progress.	
Н х.х	Drive running, display shows output frequency (Hz)	Whilst the drive is running, the following displays can be
Я х.х	Drive running, display shows motor current (Amps)	selected by briefly pressing the button on the drive.
Р х.х	Drive Running, display shows motor power (kW)	Each press of the button will cycle the display through to the
C x.x	Drive Running, display shows customer selected units, see parameters P2-21 and P2-22	next selection.
EFT-54	Drive mains power not present, external 24 Volt control power	r supply present only
I nh ibb	Output power hardware inhibited, hardware enable circuit op and 13) as shown in section 4.9 Connection Diagram	en. External links are required to the STO inputs (terminals 12
P-dEF	Parameters reset to factory default settings	
U-dEF	Parameters reset to User default settings	
For drive fault	code displays, refer to section 11.1 on page 46	

5.5. Keypad Layout and Function - Optional OLED Keypad

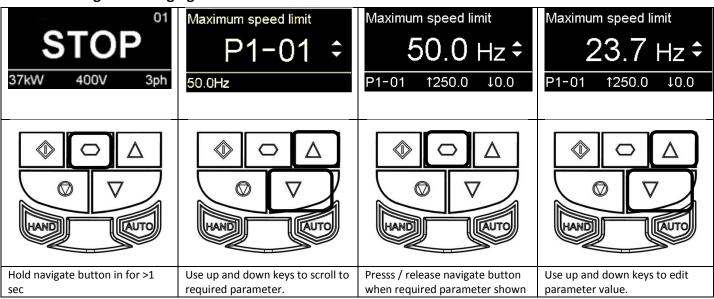

An optional Multi Language OLED display keypad may be specified at the time of order, option code –Tx. This option is not available for IP20 drives.

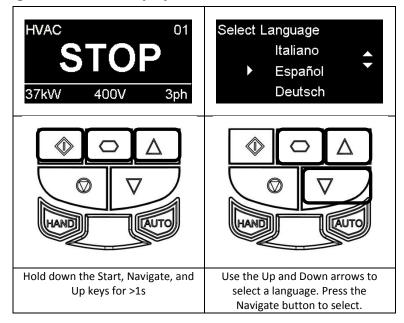

5.6. Drive Operating Displays

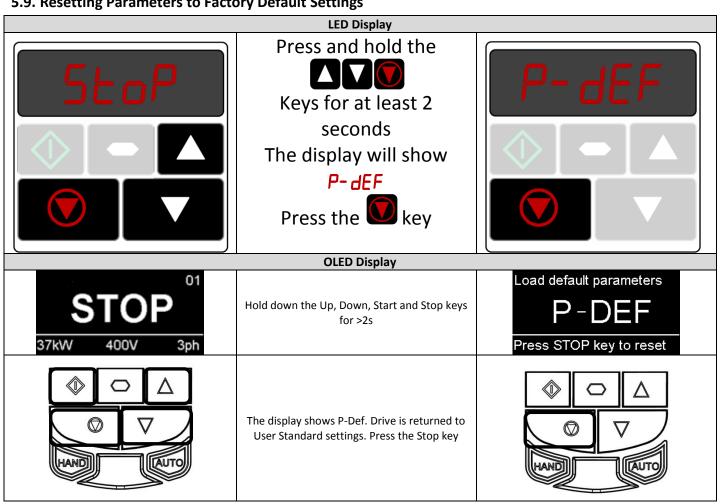

5.7. Accessing and Changing Parameter Values

5.8. Changing the Language on the OLED Display

5.9. Resetting Parameters to Factory Default Settings

5.10. Terminal Control

When delivered, the Optidrive is in the factory default state, meaning that it is set to operate in terminal control mode and all parameters have the default values as indicated in section 6.

- Connect the drive to the supply, ensuring the correct voltage and fusing / circuit breaker protection see section 10.2.
- Connect the motor to the drive, ensuring the correct star/delta connection for the voltage rating see section 4.6.
- Apply the mains power to the drive, then enter the motor data from motor nameplate; P1-07 = motor rated voltage, P1-08 = motor rated current, P1-09 = motor rated frequency.
- Connect the Drive Hardware Enable (STO) circuit as follows (see section 4.8 for further details)
 - Link Terminal 1 to Terminals 12 (STO +)
 - Link Terminal 9 to Terminal 13 (STO -)
- Connect a control switch between the control terminals 1 and 2 ensuring that the contact is open (drive disabled).
- Connect a potentiometer ($1k\Omega$ min to $10 k\Omega$ max) between terminals 5 and 7, and the wiper to terminal 6.
- With the potentiometer set to zero, switch on the supply to the drive. The display will show 5toP.
- Close the control switch, terminals 1-2. The drive is now 'enabled' and the output frequency/speed are controlled by the potentiometer. The display shows zero speed in Hz (H 0.0) with the potentiometer turned to minimum.
- Turn the potentiometer to maximum. The motor will accelerate to 50Hz, (60Hz for HP drives), the default value of P1-01, under the
 control of the acceleration ramp time P1-03.
- If the potentiometer is turned to minimum, the motor will decelerate to 0Hz, the default minimum speed set in P1-02, under the control of the deceleration ramp P1-04. The output speed can be adjusted anywhere between minimum and maximum speed using the potentiometer.
- To display motor current (Amps), briefly press the (Navigate) key.
- Press again to display the motor power.
- Press again to return to speed display.
- To stop the motor, disable the drive by opening the control switch (terminals 1-2).
- If the enable/disable switch is opened the drive will decelerate to stop at which time the display will show 5top.

5.11. Keypad Control

To allow the Optidrive to be controlled from the keypad in a forward direction only, set P1-12 =1:

- Connect the drive to the supply, ensuring the correct voltage and fusing / circuit breaker protection see section 10.2.
- Connect the motor to the drive, ensuring the correct star/delta connection for the voltage rating see section 4.6.
- Apply the mains power to the drive, then enter the motor data from motor nameplate; P1-07 = motor rated voltage, P1-08 = motor rated current, P1-09 = motor rated frequency.
- Connect the Drive Hardware Enable (STO) circuit as follows (see section 4.8 for further details)
 - Link Terminal 1 to Terminals 13 (STO +)
 - o Link Terminal 9 to Terminal 12 (STO -)
- Connect a control switch between the control terminals 1 and 2 ensuring that the contact is open (drive disabled).
- Enable the drive by closing the switch between control terminals 1 & 2. The display will show 5toP.
- Press the key. The display shows H D.D.
- Press to increase speed.
- The drive will run forward, increasing speed until is release
- Press to decrease speed. The drive will decrease speed until is released. The rate of deceleration is limited by the setting in P1-04
- Press the key. The drive will decelerate to rest at the rate set in P1-04.
- The display will finally show 5toP at which point the drive is disabled
- To preset a target speed prior to enable, press the key whilst the drive is stopped. The display will show the target speed, use the keys to adjust as required then press the key to return the display to 5toP.
- Pressing the key will start the drive accelerating to the target speed.
- To allow the Optidrive to be controlled from the keypad in a forward and reverse direction, set P1-12 =2:
- Operation is the same as when P1-12=1 for start, stop and changing speed.
- Press the key. The display changes to H 0.0.
- Press to increase speed
- The drive will run forward, increasing speed until is released. Acceleration is limited by the setting in P1-03. The maximum speed is the speed set in P1-01.
- To reverse the direction of rotation of the motor, press the key again

5.12. Operating in Sensorless Vector Speed Control Mode

Optidrive P2 can be programmed by the user to operate in Sensorless Vector mode, which provides enhanced low speed torque, optimum motor speed regulation regardless of load and accurate control of the motor torque. In most applications, the default Voltage Vector control mode will provide adequate performance, however if Sensorless Vector operation is required, use the following procedure.

- Ensure advanced parameter access is enabled by setting P1-14 = 101
- Enter the motor nameplate details into the relevant parameters as follows
 - o P1-07 Motor Rated Voltage
 - o P1-08 Motor Rated Current
 - o P1-09 Motor Rated Frequency
 - o (Optional) P1-10 Motor Rated Speed (Rpm)
 - o P4-05 Motor Power Factor
- Select Sensorless Vector control mode by setting P4-01 = 0
- Ensure that the motor is correctly connected to the drive
- Carry out a motor data Autotune by setting P4-02 = 1

The Autotune will begin immediately when P4-02 is set regardless of the status of the drive enable signal. Whilst the autotune procedure does not drive or spin the motor, the motor shaft may still turn slightly. It is not normally necessary to uncouple the load from the motor; however the user should ensure that no risk arises from the possible movement of the motor shaft.

It is essential that the correct motor data is entered into the relevant drive parameters. Incorrect parameter settings can result in poor or even dangerous performance.

6. Parameters

6.1. Parameter Set Overview

The Optidrive P2 Parameter set consists of 6 groups as follows:

- Group 0 Read Only Monitoring Parameters
- Group 1 Basic Configuration Parameters
- Group 2 Extended Parameters
- Group 3 PID Control Parameters
- Group 4 High Performance Motor Control Parameters
- Group 5 –Field Bus Parameters

When the Optidrive is reset to factory defaults, or is in its factory supplied state, only Group 1 Parameters can be accessed. In order to allow access to parameters from the higher level groups, P1-14 must be set to the same value as P2-40 (Default setting = 101). With this setting, parameter groups 1 – 5 can be accessed, along with the first 38 parameters in Group 0.

6.2. Parameter Group 1 – Basic Parameters

Par	Parameter Name	Minimum	Maximum	Default	Units		
P1-01	Maximum Frequency / Speed Limit	P1-02	500.0	50.0 (60.0)	Hz / Rpm		
	Maximum output frequency or motor speed limit – Hz or rpm.						
	If P1-10 >0, the value entered / displayed is in Rpm						
P1-02	Minimum Frequency / Speed Limit	0.0	P1-01	0.0	Hz / Rpm		
	Minimum speed limit – Hz or rpm.						
	If P1-10 >0, the value entered / displayed is in Rpm						
P1-03	Acceleration Ramp Time	See B	elow	5.0 / 10.0	Seconds		
	Acceleration ramp time from 0 to base speed (P-1-09) in seconds.						
	Note						
	FS2 & FS3: 5.0 Seconds Default Setting, 0.01 Seconds Resolution, 600.0 Secon						
	FS4 – FS7: 10.0 Seconds Default Setting, 0.1 Seconds Resolution, 6000 Second	ds Maximum					
P1-04	Deceleration Ramp Time	See B		5.0 / 10.0	Seconds		
	Deceleration ramp time from base speed (P1-09) to standstill in seconds. Wh	en set to zero, t	fastest possibl	e ramp time wit	thout trip is

Optidrive ODP-2 User Guide Revision 1.10

P1-11	V/F Mode Voltage Boost	0.0	Drive Ratin	g Dependent	%				
	Voltage boost is used to increase the applied motor voltage at low output frequencies, in order to improve low speed and starting								
	torque. Excessive voltage boost levels may result in increased motor current a	and temperature	e, and force ve	entilation of the	motor may				
	be required.								
	An automatic setting (Auto) is also possible, whereby the Optidrive will automatically adjust this parameter based on the motor								
	parameters measured during an autotune.								
P1-12	Primary Command Source Mode	0	6	0	-				
	0: Terminal Control. The drive responds directly to signals applied to the cont	rol terminals.							
	1: Uni-directional Keypad Control. The drive can be controlled in the forward	d direction only	using an exter	nal or remote k	Ceypad				
	2: Bi-directional Keypad Control. The drive can be controlled in the forward a	ind reverse dire	ctions using a	n external or re	mote				
	Keypad. Pressing the keypad START button toggles between forward and reve	erse.							
	3: PID Control. The output frequency is controlled by the internal PID controll	er.							
	4: Fieldbus Control. Control via Modbus RTU if no fieldbus interface option is present, otherwise control is from the fieldbus option								
	module interface								
	5: Slave Mode. The drive acts as a Slave to a connected Optidrive operating in Master Mode								
	6 : CAN bus Control. Control via CAN bus connected to the RJ45 serial interface connector								
P1-13	Digital Inputs Function Select	0	21	1	-				
	Defines the function of the digital inputs depending on the control mode setting in								
	P1-12. See section 7.1 for more information.								
P1-14	Extended Menu Access Code	0	30000	0	-				
	Parameter Access Control. The following settings are applicable :								
	P1-14 = P2-40 = 101 : Allows access to Parameter Groups 0 – 5

The "Selected Speed Reference" referred to in the above table is determined by the value set in P1-12 (Control Mode):

P1-12 (control Mode)	Selected Speed Reference
0 : Terminal Mode	Analog input 1
1 : Keypad Mode (uni-directional)	Digital Potentiometer
2 : Keypad Mode (bi-directional)	Digital Potentiometer
3 : User PID mode	PID controller output
4 : Fieldbus Control	Speed reference via Fieldbus
5 : Slave Mode	Speed reference via Optibus

^{*}Note: If a motor thermistor is to be connected, this must be selected in P2-33.

8. Extended Parameters

8.1. Parameter Group 2 - Extended parameters

Par	Parameter Name	Minimum	Maximum	Default	Units
P2-01	Preset / Jog Frequency / Speed 1	P1-02	P1-01	5.0	Hz / Rpm
P2-02	Preset / Jog Frequency / Speed 2	P1-02	P1-01	10.0	Hz / Rpm
P2-03	Preset / Jog Frequency / Speed 3	P1-02	P1-01	25.0	Hz / Rpm
P2-04	Preset / Jog Frequency / Speed 4	P1-02	P1-01	50.0 (60.0)	Hz / Rpm
P2-05	Preset / Jog Frequency / Speed 5	P1-02	P1-01	0.0	Hz / Rpm
P2-06	Preset / Jog Frequency / Speed 6	P1-02	P1-01	0.0	Hz / Rpm
P2-07	Preset / Jog Frequency / Speed 7	P1-02	P1-01	0.0	Hz / Rpm
P2-08	Preset / Jog Frequency / Speed 8	P1-02	P1-01	0.0	Hz / Rpm
	Preset Speeds / Frequencies selected by digital inputs depending on the setting	ng of P1-13.			
	If P1-10 = 0, the values are entered as Hz. If P1-10 > 0, the values are entered	as Rpm.			
	Setting a negative value will reverse the direction of motor rotation.				
P2-09	Skip Frequency Centre Point	P1-02	P1-01	0.0	Hz / Rpm
P2-10	Skip Frequency Band Width	0.0	P1-01	0.0	Hz / Rpm
	The Skip Frequency function is used to avoid the Optidrive operating at a cert				
	which causes mechanical resonance in a particular machine. Parameter P2-09		•		,
	and is used conjunction with P2-10. The Optidrive output frequency will ramp	ū			
	and P1-04 respectively, and will not hold any output frequency within the def		. ,		ed to the
	drive is within the band, the Optidrive output frequency will remain at the up

	Optidrive ODP-2 User Guide Revision	on 1.10							
P2-21	Display Scaling Factor	-30.000	30.000	0.000	-				
P2-22	Display Scaling Source	0	2	0	-				
	P2-21 & P2-22 allow the user to program the Optidrive to display an alternati	ve output unit	scaled from a	an existing para	meter, e.g.				
	to display conveyer speed in metres per second based on the output frequency. This function is disabled if P2-21 is set to 0.								
	If P2-21 is set >0, the variable selected in P2-22 is multiplied by the factor ent	ered in P2-21,	and displayed	d whilst the driv	e is				
	running, with a 'c' to indicate the customer scaled units.								
	P2-22 Options								
	0: Motor Speed								
	1: Motor Current								
	2: Analog Input 2								
	3: P0-80 Value	ı							
P2-23	Zero Speed Holding Time	0.0	60.0	0.2	Seconds				
	Determines the time for which the drive output frequency is held at zero whe	1							
P2-24	Effective Switching Frequency		e Rating Depe		kHz				
	Effective power stage switching frequency. The range of settings available and								
	drive power and voltage rating. Higher frequencies reduce the audible 'ringin	g' noise from	the motor, an	d improve the d	output				
	current waveform, at the expense of increased drive losses								
P2-25	2nd Deceleration Ramp Time	0.00	240.0	0.00	Seconds				
	This parameter allows an alternative deceleration ramp down time to be prog								
	digital inputs (dependent on the setting of P1-13) or selected automatically in	n the case of a	mains power	loss if $P2-38 = 2$	<u>'</u> .				
	When set to 0.0, the drive will coast to stop.		_						
P2-26	Spin Start Enable	0	1	0	-				
	0: Disabled 1: Enabled. When enabled, on start up the drive will attempt to determine if the motor is already rotating, and will begin to control								
				-	וו נט נטוונוטו				
D2 27	the motor from its current speed. A short delay may be observed when starting	1		0.0	Seconds				
P2-27	Standby Mode Timer This parameter defines time period, whereby if the drive operates at minimum	0.0	250.0						
				time periou, tin	e Optiurive				
P2-28	output will be disabled, and the display will show 5tndby. The function is disabled Slave Speed Scaling Control	0	= 0.0.	0					
PZ-20	Active in Keypad mode (P1-12 = 1 or 2) and Slave mode (P1-12=5) only. The k		_	~	- cot cooling				
	factor or adjusted using an analog trim or offset.	eypau reieren	ce can be mu	itiplied by a pre	set scaling				
	0 : Disabled. No scaling or offset is applied.								
	1 : Actual Speed = Digital Speed x P2-29								
	2 : Actual Speed = (Digital Speed x P2-29) + Analog Input 1 Reference								
	3 : Actual Speed = (Digital Speed x P2-29) x Analog Input 1 Reference								
P2-29	Slave Speed Scaling Factor	-500.0	500.0	100.0	%				
	Used in conjunction with P2-28.								
P2-30	Analog Input 1 (Terminal 6) Format	See E	Below	U 0- 10	-				
	U □- I□ = 0 to 10 Volt Signal (Uni-polar)	•							
	<u>U</u>								
	- ID- ID = -10 to +10 Volt Signal (Bi-polar)								
	R □-2□ = 0 to 20mA Signal								
	1	H U-2U = 0 to 20mA Signal L Y-2D = 4 to 20mA Signal, the Optidrive will trip and show the fault code Y-2DF if the signal level falls below 3mA							
	- 4-20 = 4 to 20mA Signal, the Optidrive will ramp to stop if the signal level 1			Delow Silia					
	E 20-4 = 20 to 4mA Signal, the Optidrive will trip and show the fault code 4-			olow 2m A					
		_		DEIOW SITIA					
D2 24	r 20-4 = 20 to 4mA Signal, the Optidrive will ramp to stop if the signal level f			100.0	0/				
P2-31	Analog Input 1 Scaling	0.0	500.0		%				
	Scales the analog input by this factor, e.g. if P2-30 is set for 0 – 10V, and the s	scaling factor i	s set to 200.09	%, a 5 voit input	wiii result				
D2 22	in the drive running at maximum speed (P1-01)	F00.0	F00.0	0.0	0/				
P2-32	Analog Input 1 Offset	-500.0	500.0	0.0	%				
	Sets an offset, as a percentage of the full scale range of the input, which is ap	plied to the ar	naiog input sig	nai

8.2. Parameter Group 3 – PID Control

Par	Parameter Name	Minimum	Maximum	Default	Units								
P3-01	PID Proportional Gain	0.1	30.0	1.0	-								
	PID Controller Proportional Gain. Higher values provide a greater change in the	he drive outpu	t frequency ir	response to sn	nall changes								
	in the feedback signal. Too high a value can cause instability				_								
P3-02	PID Integral Time Constant	0.0	30.0	1.0	S								
	PID Controller Integral Time. Larger values provide a more damped response	for systems w	here the over	all process resp	onds slowly								
P3-03	PID Differential Time Constant	0.00	1.00	0.00	s								
	PID Differential Time Constant												
P3-04	PID Operating Mode	0	1	0	-								
	0 : Direct Operation . Use this mode if an increase in the motor speed should		_	~									
	1: Inverse Operation. Use this mode if an increase in the motor speed should												
P3-05	PID Reference (Setpoint) Source Select	0	2	0	-								
1 3-03	Selects the source for the PID Reference / Setpoint	U	2	0									
	0 : Digital Preset Setpoint. P3-06 is used												
	1: Analog Input 1 Setpoint. P3-06 is used												
	2 : Analog Input 2 Setpoint												
P3-06	PID Digital Reference (Setpoint)	0.0	100.0	0.0	%								
F 3-00	When P3-05 = 0, this parameter sets the preset digital reference (setpoint) us			0.0	70								
P3-07	PID Controller Output Upper Limit	P3-08	100.0	100.0	%								
P3-U/	Limits the maximum value output from the PID controller	P3-06	100.0	100.0	70								
D2 00	,	0.0	D2 07	0.0	9/								
P3-08	PID Controller Output Lower Limit	0.0	P3-07	0.0	%								
	Limits the minimum output from the PID controller												
P3-09	PID Output Limit Control	0	3	0	-								
	0 : Digital Output Limits. The output range of the PID controller is limited by 1 : Analog Input 1 Provides a Variable Upper Limit. The output range of the I												
	Input 1 & the value of P3-07 3: PID output Added to Analog Input 1 Value. The output value from the PID	Controller is a	added to the s	peed reference	applied to								
	the Analog Input 1												
P3-10	PID Feedback Signal Source Select	0	1	0	-								
	0 : Analog Input 2												
	1 : Analog Input 1		1	1									
P3-11	Maximum PID Error to Enable Ramps	0.0	25.0	0.0	%								
	Defines a threshold PID error level, whereby if the difference between the setpoint and feedback values is less than the set threshold,												
	the internal ramp times of the drive are disabled. Where a greater PID error exists, the ramp times are enabled to limit the rate of												
	change of motor speed on large PID errors, and react quickly to small errors.												
	Setting to 0.0 means that the drive ramps are always enabled. This parameter is intended to allow the user to disable the drive												
	internal ramps where a fast reaction to the PID control is required, however l		ng the ramps	when a small Pl	D error exists								
	the risk of possible over current or over voltage trips being generated are red		ı	1									
P3-12	PID Feedback Value Display Scaling Factor	0.000	50.000	0.000	-								
	Applies a scaling factor to the displayed PID feedback, allowing the user to dis	splay the actu	al signal level	from a transduc	er, e.g. 0 – 10								
	Bar etc.			1									
P3-13	PID Feedback Wake Up Level	0.0	100.0	0.0	%								
	Sets a programmable level whereby if the drive enters standby motor whilst	operating und	er PID control	, the selected fe	edback signa								
	must fall below this threshold before the drive will return to normal operatio	n.											
P3-18	PID Operation Control	-	-	-	-								
	0 : Continuous PID Operation. In this operating mode, the PID controller ope	rates continuo	ously, regardle	ess of whether t	he drive is								
	enabled or disabled. This can result in the output of the PID controller reaching applied. 1: PID operation on Drive Enable. In this operating mode, the PID controller	ng the maximu	ım level prior	to the drive ena	ible signal								
	always start from zero when the drive is enabled.	om, operates	cii tiic all	. e io chabica, ai	.a nence will								

8.3. Parameter Group 4 – High Performance Motor Control

/	7	Incorrect adjustment of parameters in menu group 4 can cause uner machinery. It is recommended that these parameters are only adjusted.			notor and any c	onnected

8.4. Parameter Group 5 – Communication Parameters

Par.	Name	Minimum	Maximum	Default	Units
P5-01	Drive Fieldbus Address	0	63	1	-
	Sets the fieldbus address for the Optidrive	-			
P5-02	CAN Open Baud Rate	125	1000	500	kbps
	Sets the baud rate when CAN Open communications are used				- 1
P5-03	Modbus RTU Baud Rate	9.6	115.2	115.2	kbps
	Sets the baud rate when Modbus RTU communications are used			-	- 1
P5-04	Modbus Data Format	-	-	-	-
	Sets the expected Modbus telegram data format as follows				
	n- 1: No Parity, 1 stop bit				
	n-2 : No parity, 2 stop bits				
	☐- I: Odd parity, 1 stop bit				
	E- 1: Even parity, 1 stop bit				
P5-05	Communications Loss Timeout	0.0	5.0	2.0	Seconds
	Sets the watchdog time period for the communications channel. If a valid telegram is			_	
	period, the drive will assume a loss of communications has occurred and react as sele				
P5-06	Communications Loss Action	0	3	0	-
	Controls the behaviour of the drive following a loss of communications as determined	by the above p	arameter sett	ing.	
	0 : Trip & Coast To Stop			J	
	1 : Ramp to Stop Then Trip				
	2 : Ramp to Stop Only (No Trip)				
	3: Run at Preset Speed 8				
P5-07	Fieldbus Ramp Control	0	1	0	-
	Selects whether the acceleration and deceleration ramps are control directly via the F	ieldbus, or by i	nternal drive p	arameters F	1-03 and
	P1-04.				
	0 : Disabled . Ramps are control from internal drive parameters				
	1 : Enabled. Ramps are controlled directly by the Fieldbus				
P5-08	Fieldbus Process Data Output Word 4 Select	0	4	0	-
	When using an optional fieldbus interface, this parameter configures the parameter s	ource for the 4 ^t	^h process data	word trans	ferred
	from the drive to the network master during cyclic communications				
	0 : Output Torque – 0 to 2000 = 0 to 200.0%				
	1: Output Power – Output power in kW to two decimal places, e.g. 400 = 4.00kW				
	2 : Digital Input Status – Bit 0 indicates digital input 1 status, bit 1 indicates digital inp	ut 2 status etc.			
	3 : Analog Input 2 Signal Level – 0 to 1000 = 0 to 100.0%				
DE 12	4 : Drive Heatsink Temperature – 0 to 100 = 0 to 100°C	0	7	0	
P5-12	Fieldbus Process Data Output Word 3 Select When using an optional fieldbus interface, this parameter configures the parameter s	_	=	_	forrad
	from the drive to the network master during cyclic communications	burce for the 5	process data	i word trails	ierreu
	0: Motor current – Output current to 1 decimal place, e.g. 100 = 10.0 Amps				
	1: Power (x.xx kW) Output power in kW to two decimal places, e.g. 400 = 4.00kW				
	2: Digital input status – Bit 0 indicates digital input 1 status, bit 1 indicates digital input	ıt 2 status etc.			
	3: Analog Input 2 Signal Level - 0 to 1000 = 0 to 100.0%				
	4: Drive Heatsink Temperature – 0 to 100 = 0 to 100°C				
	5: User register 1 – User Defined Register 1 Value				
	6: User register 2– User Defined Register 1 Value				
	7: P0-80 value – User Selected data value.				
P5-13	Fieldbus Process Data Input Word 4 Select	0	1	0	-
	When using an optional fieldbus interface, this parameter configures destination for t	he 4 th process o	lata word rece	eived by the	drive from
	the network master during cyclic communications				
	0: Fieldbus Ramp Control – This option must be selected if the drive acceleration and	deceleration ra	imps are to be	controlled 1	rom the
	fieldbus. P5-07 must also be set to 1 to enable this function.				
	1: User register 4 – The value received by the drive in PDI 4 is transferred to User Reg				
	process data word to be defined in Parameter Group 9. In this case, User Register 4 sh	ould not be wr	itten to withir	any PLC fur	nction
	code, although the value can be read.				
P5-14	Fieldbus Process Data Input Word 3 Select	0	2	0	-
	When using an optional fieldbus interface, this parameter configures destination for t	he 3 process o	ata word rece	eived by the	drive from
	the network master during cyclic communications		4 a la e ' ''	a al £0 11	الدايد
	0: Torque limit/reference – This option must be selected if the drive output torque line. This plan requires eathing PA OC.	nit / setpoint is	το be controll	ea from the	TIEIdbus.

8.5. Parameter Group 0 – Monitoring Parameters (Read Only)

Par	Description	Units
P0-01	Analog Input 1 Applied Signal Level	%
	Displays the signal level applied to analog input 1 (Terminal 6) after scaling and offsets have been applied.	•
P0-02	Analog Input 2 Applied Signal Level	%
	Displays the signal level applied to analog input 2 (Terminal 10) after scaling and offsets have been applied.	
P0-03	Digital Input Status	-
	Displays the status of the drive inputs, starting with the left hand side digit = Digital Input 1 etc.	
P0-04	Pre Ramp Speed Controller Reference	Hz
	Displays the set point reference input applied to the drive internal speed controller	
P0-05	Torque Controller Reference	%
	Displays the set point reference input applied to the drive internal torque controller	
P0-06	Digital Speed Reference (Motorised Pot)	Hz
	Displays the value of the drive internal Motorised Pot (used for keypad) speed reference	
P0-07	Fieldbus Communication Speed Reference	Hz
	Displays the setpoint being received by the drive from the currently active Fieldbus interface.	•
P0-08	PID Reference (Setpoint)	%
	Displays the setpoint input to the PID controller.	•
P0-09	PID Feedback Level	%
	Displays the Feedback input signal to the PID controller	•
P0-10	PID Controller Output	%
	Displays the output level of the PID controller	•
P0-11	Applied Motor Voltage	V
	Displays the instantaneous output voltage from the drive to the motor	
P0-12	Output Torque	%
	Displays the instantaneous output torque level produced by the motor	
P0-13	Trip History Log	-
	Displays the last four fault codes for the drive. Refer to section 11.1 for further information	
P0-14	Motor Magnetising Current (Id)	Α
	Displays the motor magnetising Current, providing an auto tune has been successfully completed.	•
P0-15	Motor Rotor Current (Iq)	Α
	Displays the motor Rotor (torque producing) current, providing an auto tune has been successfully completed.	
P0-16	DC Bus Voltage Ripple Level	V
	Displays the level of ripple present on the DC Bus Voltage. This parameter is used by the Optidrive for various internal p	rotection and
	monitoring functions.	
P0-17	Motor Stator resistance (Rs)	Ω
	Displays the measured motor stator resistance, providing an auto tune has been successfully completed.	
P0-18	Motor Stator Inductance (Ls)	Н
	Displays the measured motor stator inductance, providing an auto tune has been successfully completed.	
P0-19	Motor Rotor Resistance (Rr)	Ohms
	Displays the measured motor rotor resistance, providing an auto tune has been successfully completed.	
P0-20	DC Bus Voltage	V
	Displays the instantaneous DC Bus Voltage internally within the drive	
P0-21	Drive Temperature	°C
	Displays the Instantaneous Heatsink Temperature measured by the drive	
P0-22	Time Remaining to next service	V
	Displays the number of hours remaining on the service time counter before the next service is due.	
P0-23	Operating Time Accumulated With Heatsink Temperature Above 80°C	HH:MM:SS
	Displays the amount of time in hours and minutes that the Optidrive has operated for during its lifetime with a heatsink	
	in excess of 80°C. This parameter is used by the Optidrive for various internal protection and monitoring functions.	
P0-24	Operating Time Accumulated With Ambient Temperature Above 80°C	HH:MM:SS
	Displays the amount of time in hours and minutes that the Optidrive has operated for during its lifetime with an ambier	
	temperature in excess of 80°C. This parameter is used by the Optidrive for various internal protection and monitoring fu	
P0-25	Rotor Speed (Estimated or Measured)	-
	In Vector control mode, this parameter displays either the estimated rotor speed of the motor, if no encoder feedback i	s present or
	the measured rotor speed if an optional Encoder Feedback Interface Option is fitted.	o present, or
	The measured rotor speed it an optional encoder recuback interface option is littled.	

	Optidrive ODP-2 User Guide Revision 1.10	
P0-26	Energy Consumption kWh Meter	kWh
	Displays the amount of energy consumed by the drive in kWh. When the value reaches 1000, it is reset back to 0.0, and	the value of
	P0-27 (*MWh meter) is increased.	
P0-27	Energy Consumption MWh Meter	MWh
	Displays the amount of energy consumed by the drive in MWh.	
P0-28	Software Version and Checksum	-
	Displays the software version of the drive	
P0-29	Drive Type	-
	Displays the type details of the drive	
P0-30	Drive Serial Number	-
	Displays the unique serial number of the drive.	
P0-31	Drive Lifetime Operating Time	HH:MM:SS
	Displays the total operating time of the drive. The first value shown is the number of hours. Pressing the Up key will disp	olay the
	minutes and seconds.	
P0-32	Drive Run Time Since Last Trip (1)	HH:MM:SS
	Displays the total operating time of the drive since the last fault occurred. The first value shown is the number of hours.	Pressing the
	Up key will display the minutes and seconds.	
P0-33	Drive Run time Since Last Trip (2)	HH:MM:SS
	Displays the total operating time of the drive since the last fault occurred. The first value shown is the number of hours.	Pressing the
	Up key will display the minutes and seconds.	
P0-34	Drive Run Time Since Last Disable	HH:MM:SS
	Displays the total operating time of the drive since the last Run command was received. The first value shown is the nur	nber of
	hours. Pressing the Up key will display the minutes and seconds.	
P0-35	Drive Internal Cooling Fan Total Operating Time	HH:MM:SS
	Displays the total operating time of the Optidrive internal cooling fans. The first value shown is the number of hours. Pr	essing the Up
	key will display the minutes and seconds. This is used for scheduled maintenance information	
P0-36	DC Bus Voltage Log (256ms)	V
P0-37	DC Bus Voltage Ripple Log (20ms)	V
P0-38	Heatsink Temperature Log (30s)	°C
P0-39	Ambient Temperature Log (30s)	°C
P0-40	Motor Current Log (256ms)	Α
	The above parameters are used to store the history of various measured levels within the drive at various regular time i	
	to a trip. The values are frozen when a fault occurs and can be used for diagnostic purposes – see section for further inf	ormation.
P0-41	Critical Fault Counter – Over Current	-
P0-42	Critical fault counter – Over Voltage	-
P0-43	Critical fault counter – Under Voltage	-
P0-44	Critical fault counter – Over Temperature	-
P0-45	Critical fault counter – Brake Transistor Over Current	-
P0-46	Critical fault counter – Ambient Over Temperature	-
	These parameters contain a record of how many times certain critical faults have occurred during a drives operating life	time. This
	provides useful diagnostic data	
P0-47	Reserved	-
	Reserved Parameter	
P0-48	Reserved	-
	Reserved Parameter	
P0-49	Modbus RTU Communication Error Counter	-
	This parameter is incremented every time an error occurs on the Modbus RTU communication link. This information can	n be used for
	diagnostic purposes.	
P0-50	CAN Open Communication Error Counter	-
	This parameter is incremented every time an error occurs on the CAN Open communication link. This information can b	e used for
	diagnostic purposes.	

9. Serial communications

9.1. RS-485 communications

Optidrive P2 has an RJ45 connector on the front of the control panel. This connector allows the user to set up a drive network via a wired connection. The connector contains two independent RS485 connections, one for Invertek's Optibus Protocol and one for Modbus RTU. Both connections can be used simultaneously.

The electrical signal arrangement of the RJ45 connector is shown as follows:

The Optibus data link uses the same communication protocol as is used for IrDA communication. This is used for the Master / Slave function (refer to the Optidrive P2 Advanced User Guide for further information). Up to 62 slaves can be connected to one master drive.

The Modbus interface allows connection to a Modbus RTU network as described below.

9.2. Modbus RTU Communications

9.2.1. Modbus Telegram Structure

The Optidrive P2 supports Master / Slave Modbus RTU communications, using the 03 Read Holding Registers and 06 Write Single Holding Register commands. Many Master devices treat the first Register address as Register 0; therefore it may be necessary to convert the Register Numbers detail in section 0 by subtracting 1 to obtain the correct Register address. The telegram structure is as follows:-

Cor	Command 03 – Read Holding Registers										
Master Telegram	Length		Length Slave Response		Length						
Slave Address	1	Byte		Slave Address	1	Byte					
Function Code (03)	1	1 Byte		Function Code (03)	1	Byte					
1 st Register Address	2	2 Bytes		Byte Count	1	Byte					
No. Of Registers	2	Bytes		1 st Register Value	2	Bytes					
CRC Checksum	2 Bytes			2 nd Register Value	2	Bytes					
				Etc							
				CRC Checksum	2	Bytes					

Command 06 – Write Single Holding Register										
Master Telegram	Length			Slave Response	Length					
Slave Address	1	Byte		Slave Address	1	Byte				
Function Code (06)	1	1 Byte		Function Code (06)	1	Byte				
Register Address	2	Bytes		Register Address	2	Bytes				
Value	2	Bytes		Register Value	2	Bytes				
CRC Checksum	C Checksum 2 Bytes			CRC Checksum	2	Bytes				

9.2.2. Modbus Control & Monitoring Registers

The following is a list of accessible Modbus Registers available in the Optidrive P2.

- When Modbus RTU is configured as the Fieldbus option (P5-01 = 0, factory default setting), all of the listed registers can be accessed.
- Registers 1 and 2 can be used to control the drive providing that Modbus RTU is selected as the primary command source (P1-12 = 4)
- Register 3 can be used to control the output torque level providing that
 - The drive is operating in Vector Speed or Vector Torque motor control modes (P4-01 = 1 or 2)
 - The torque controller reference / limit is set for 'Fieldbus' (P4-06 = 3)
- Register 4 can be used to control the acceleration and deceleration rate of the drive providing that Fieldbus Ramp Control is enabled (P5-08 = 1)

Registers 6 to 24 can be read regardless of the setting of P1-12

Register	Upper Byte	Lower Byte	Read	Notes	
Number	0 10		Write		
	Command Cor	ntrol Word	R/W	Command control word used to control the Optidrive when operating with Modbus	
				RTU. The Control Word bit functions are as follows:-	
				Bit 0 : Run/Stop command. Set to 1 to enable the drive. Set to 0 to stop the drive.	
1				Bit 1 : Fast stop request. Set to 1 to enable drive to stop with 2 nd deceleration ramp.	
				Bit 2 : Reset request. Set to 1 in order to reset any active faults or trips on the drive.	
				This bit must be reset to zero once the fault has been cleared.	
				Bit 3 : Coast stop request. Set to 1 to issue a coast stop command.	
2	Command Spe		R/W	Setpoint must be sent to the drive in Hz to one decimal place, e.g. 500 = 50.0Hz	
3	Command Tor	que Reference	R/W	Setpoint must be sent to the drive in % to one decimal place, e.g. 2000 = 200.0%	
	Command Ramp times		R/W	This register specifies the drive acceleration and deceleration ramp times used when	
4				Fieldbus Ramp Control is selected (P5-08 = 1) irrespective of the setting of P1-12. The	
				input data range is from 0 to 60000 (0.00s to 600.00s)	
	Error code	Drive status	R	This register contains 2 bytes.	
				The Lower Byte contains an 8 bit drive status word as follows :-	
6				Bit 0 : 0 = Drive Disabled (Stopped), 1 = Drive Enabled (Running)	
8				Bit 1:0 = Drive Healthy, 1 = Drive Tripped	
				The Upper Byte will contain the relevant fault number in the event of a drive trip.	
				Refer to section 11.1 for a list of fault codes and diagnostic information	
7	Output Freque	ency	R	Output frequency of the drive to one decimal place, e.g.123 = 12.3 Hz	
8	Output Currer	nt	R	Output current of the drive to one decimal place, e.g.105 = 10.5 Amps	
9	Output Torqu	е	R	Motor output torque level to one decimal place, e.g. 474 = 47.4 %	
10	Output Power	•	R	Output power of the drive to two decimal places, e.g.1100 = 11.00 kW	
11	Digital Input S	tatus	R	Represents the status of the drive inputs where Bit 0 = Digital Input 1 etc.	
20	Analog 1 Leve	I	R	Analog Input 1 Applied Signal level in % to one decimal place, e.g. 1000 = 100.0%	
21	Analog 2 Leve	og 2 Level R		Analog Input 2 Applied Signal level in % to one decimal place, e.g. 1000 = 100.0%	
22		e Ramp Speed Reference R		Internal drive frequency setpoint	
23	DC bus voltage	es	R Measured DC Bus Voltage in Volts		
24	Drive tempera	nture	R	Measured Heatsink Temperature in °C	

9.2.3. Modbus Parameter Access

All User Adjustable parameters (Groups 1 to 5) are accessible by Modbus, except those that would directly affect the Modbus communications, e.g.

- P5-01 Communication Protocol Select
- P5-02 Drive Fieldbus Address
- P5-03 Modbus RTU Baud Rate
- P5-04 Modbus RTU Data Format

All parameter values can be read from the drive and written to, depending on the operating mode of the drive – some parameters cannot be changed whilst the drive is enabled for example.

When accessing a drive parameter via Modbus, the Register number for the parameter is the same as the parameter number, E.g. Parameter P1-01 = Modbus Register 101.

Modbus RTU supports sixteen bit integer values, hence where a decimal point is used in the drive parameter, the register value will be multiplied by a factor of ten,

E.g. Read Value of P1-01 = 500, therefore this is 50.0 Hz.

For further details on communicating with Optidrive using Modbus RTU, please refer to your local Invertek Sales Partner.

10.Technical Data

10.1. Environmental

Ambient temperature range Operational :-10 ... 50 °C (IP20 Units), 40°C (IP55 Units), 30°C (IP55, 90kW / 150HP units)

Storage : -40 $^{\circ}$ C ... 60 $^{\circ}$

 $\begin{tabular}{lll} Max altitude for rated operation & : 1000m \\ Derating above 1000m (to 4000m max) & : 1\% / 100m \\ \end{tabular}$

Relative Humidity : < 95% (non condensing)

Note : Drive must be Frost and moisture free at all times

Installation above 2000m is not UL approved

10.2. Output Power and Current ratings

The following tables provide the output current rating information for the various Optidrive P2 models. Invertek Drives always recommend that selection of the correct Optidrive is based upon the motor full load *current* at the incoming supply voltage.

200 - 2	40 Volt	(+ / - 10%) 1	L Phase Inpu	ıt, 3 Ph	ase Out	out											
kW	HP	Nominal Input Current	Fuse Or MCB (Ty			Supply Cable Size	Nominal Output Current	Motor Cable Size		Cable		utput Cable		tput Cable		Maximum Motor Cable	Recommended Brake Resistance
			Non UL	UL	mm	AWG / kcmil		mm	AWG	Length	Ω						
0.75	1	10.5	16	15	2.5	12	4.3	1.5	14	100	100						
1.5	2	16.2	20	20	4	10	7	1.5	14	100	50						
2.2	3	23.8	25	25	10	8	10.5	1.5	14	100	35						

Note

- The maximum motor cable length stated applies to using a shielded motor cable. When using an unshielded cable, the maximum cable length limit may be increased by 50%. When using the Invertek Drives recommended output choke, the maximum cable length may be increased by 100%
- The PWM output switching from any inverter when used with a long motor cable length can cause an increase in the voltage at the motor terminals, depending on the motor cable length and inductance. The rise time and peak voltage can affect the service life of the motor.
 Invertek Drives recommend using an output choke for motor cable lengths of 50m or more to ensure good motor service life
- For UL compliant installation, use Copper wire with a minimum insulation temperature rating of 70°C, UL Class CC or Class J Fuses

kW	HP	Nominal Input	Fus			Supply Cable	Nominal Output		Motor Cable	Maximum Motor	Recommended Brake
		Current	MCB (Type B)			Size	Current		Size	Cable	Resistance
			Non UL	UL (A)	mm	AWG / kcmil		mm	AWG / kcmil	Length	Ω

Note

- The maximum motor cable length stated applies to using a shielded motor cable. When using an unshielded cable, the maximum cable length limit may be increased by 50%. When using the Invertek Drives recommended output choke, the maximum cable length may be increased by 100%
- The PWM output switching from any inverter when used with a long motor cable length can cause an increase in the voltage at the motor terminals, depending on the motor cable length and inductance. The rise time and peak voltage can affect the service life of the motor. Invertek Drives recommend using an output choke for motor cable lengths of 50m or more to ensure good motor service life
- For UL compliant installation, use Copper wire with a minimum insulation temperature rating of 70°C, UL Class CC or Class J Fuses
- Data values shown in *Italics* are provisional

10.3. Additional Information for UL Approved Installations

Optidrive P2 is designed to meet the UL requirements. In order to ensure full compliance, the following must be fully observed.

Input Power Supply Requirements										
Supply Voltage	200 – 240 RMS Volts for 230	0 Volt rated units, + /- 1	.0% variation allowed. 24	0 Volt RMS Maximum						
	380 – 480 Volts for 400 Volt	t rated units, + / - 10% v	ariation allowed, Maxim	um 500 Volts RMS						
Imbalance	Maximum 3% voltage variat	tion between phase – p	hase voltages allowed							
	All Optidrive P2 units have phase imbalance monitoring. A phase imbalance of > 3% will result in the drive tripping.									
	For input supplies which ha	ve supply imbalance gre	eater than 3% (typically t	he Indian sub- continent & parts of Asia						
	Pacific including China) Invertek Drives recommends the installation of input line reactors. Alternatively, the drive									
	be operated as a single pha	se supply drive with 509	% derating.							
Frequency	50 – 60Hz + / - 5% Variation	1								
Short Circuit Capacity	Voltage Rating	Min kW (HP)	Max kW (HP)	Maximum supply short-circuit current						
	230V	0.37 (0.5)	18.5 (25)	5kA rms (AC)						
	230V	22 (30)	75 (100)	10kA rms (AC)						
	400 / 460V	0.75 (1)	37 (50)	5kA rms (AC)						
	400 / 460V	45 (60)	132 (200)	10kA rms (AC)						
	400 / 460V	160 (250)	250 (350)	18kA rms (AC)						
	All the drives in the above t specified maximum short-ci		·	lelivering not more than the above aximum supply voltage.						
Incoming power supply	connection must be according	ng to section 4.3								
All Optidrive P2 units ar	re intended for indoor installa	tion within controlled e	environments which mee	t the condition limits shown in section 10.1						
Branch circuit protection	n must be installed according	to the relevant nation	al codes. Fuse ratings and	types are shown in section 10.2						
Suitable Power and mo	tor cables should be selected	according to the data s	hown in section 10.2							
Power cable connection	ns and tightening torques are	shown in section 3.4								
Optidrive P2 provides n	notor overload protection in a	accordance with the Na	tional Electrical Code (US	i).						

11.Troubleshooting

11.1. Fault messages

Fault Code	No.	Description	Corrective Action
no-FLE	00	No Fault	Displayed in P0-13 if no faults are recorded in the log
OI - 6	01	Brake channel over current	Ensure the connected brake resistor is above the minimum permissible level for the drive – refer to the ratings shown in section 10.2. Check the brake resistor and wiring for possible short circuits.
OL-br	02	Brake resistor overload	The drive software has determined that the brake resistor is overloaded, and trips to protect the resistor. Always ensure the brake resistor is being operated within its designed parameter before making any parameter or system changes. To reduce the load on the resistor, increase deceleration the time, reduce the load inertia or add further brake resistors in parallel, observing the minimum resistance value for the drive in use.
0-1	03	Instantaneous over current on drive output. Excess load on the motor.	Fault Occurs on Drive Enable Check the motor and motor connection cable for phase – phase and phase – earth short circuits. Check the load mechanically for a jam, blockage or stalled condition Ensure the motor nameplate parameters are correctly entered, P1-07, P1-08, P1-09. If operating in Vector mode (P4-01 – 0 or 1), also check the motor power factor in P4-05 and ensure an autotune has been successfully completed for the connected motor. Reduced the Boost voltage setting in P1-11 Increase the ramp up time in P1-03 If the connected motor has a holding brake, ensure the brake is correctly connected and controlled, and is releasing correctly Fault Occurs When Running If operating in Vector mode (P4-01 – 0 or 1), reduce the speed loop gain in P4-03
I.E-ErP	04	Drive has tripped on overload after delivering >100% of value in P1-08 for a period of time.	Check to see when the decimal points are flashing (drive in overload) and either increase acceleration rate or reduce the load. Check motor cable length is within the limit specified for the relevant drive in section 10.2 Ensure the motor nameplate parameters are correctly entered in P1-07, P1-08, and P1-09 If operating in Vector mode (P4-01 – 0 or 1), also check the motor power factor in P4-05 and ensure an autotune has been successfully completed for the connected motor. Check the load mechanically to ensure it is free, and that no jams, blockages or other mechanical faults exist
SAFE- I	05	STO Error	Hardware Enable circuit error
0-uort	06	Over voltage on DC bus	The value of the DC Bus Voltage can be displayed in P0-20 A historical log is stored at 256ms intervals prior to a trip in parameter P0-36 This fault is generally caused by excessive regenerative energy being transferred from the load back to the drive. When a high inertia or over hauling type load is connected. If the fault occurs on stopping or during deceleration, increase the deceleration ramp time P1-04 or connect a suitable brake resistor to the drive. If operating in Vector Mode, reduce the speed loop gain P4-03 If operating in PID control, ensure that ramps are active by reducing P3-11
U-uort	07	Under voltage on DC bus	This occurs routinely when power is switched off. If it occurs during running, check the incoming supply voltage, and all connections into the drive, fuses, contactors etc.
0-E	08	Heatsink over temperature	The heatsink temperature can be displayed in P0-21. A historical log is stored at 30 second intervals prior to a trip in parameter P0-38 Check the drive ambient temperature Ensure the drive internal cooling fan is operating Ensure that the required space around the drive as shown in sections 3.5 to 3.9 has been observed, and that the cooling airflow path to and from the drive is not restricted Reduce the effective switching frequency setting in parameter P2-24 Reduce the load on the motor / drive
U-E	09	Under temperature	Trip occurs when ambient temperature is less than -10°C. The temperature must be raised over -10°C in order to start the drive.
P-dEF	10	Factory Default parameters have been loaded	Press STOP key, the drive is now ready to be configured for the required application
E-tr iP	11	External trip	E-trip requested on control input terminals. Some settings of P1-13 require a normally closed contactor to provide an external means of tripping the drive in the event that an external device develops a fault. If a motor thermistor is connected check if the motor is too hot.
50-065	12	Communications Fault	Communications lost with PC or remote keypad. Check the cables and connections to external devices
FLE-dc	13	Excessive DC Ripple	The DC Bus Ripple Voltage level can be displayed in parameter P0-22 A historical log is stored at 20ms intervals prior to a trip in parameter P0-39 Check all three supply phases are present and within the 3% supply voltage level imbalance tolerance. Reduce the motor load If the fault persists, contact your local Invertek Drives Sales Partner
P-LoSS	14	Input phase loss trip	Drive intended for use with a 3 phase supply, one input phase has been disconnected or lost.
h 0-1	15	Instantaneous over current on drive output.	Refer to fault 3 above

Optidrive ODP-2 User Guide Revision 1.10

Optidrive ODP-2 User Guide Revision 1.10				
Fault Code	No.	Description	Corrective Action	
th-FLt	16	Faulty thermistor on heatsink.	Refer to your Invertek Sales Partner.	
dALA-F	17	Internal memory fault.	Parameters not saved, defaults reloaded. Try again. If problem recurs, refer to your IDL Authorised Distributor.	
4-20F	18	4-20mA Signal Lost	The reference signal on Analog Input 1 or 2 (Terminals 6 or 10) has dropped below the minimum threshold of 3mA. Check the signal source and wiring to the Optidrive terminals.	
dAFA-E	19	Internal memory fault.	Parameters not saved, defaults reloaded. Try again. If problem recurs, refer to your IDL Authorised Distributor.	
U-dEF	20	User Parameter Defaults	User Parameter defaults have been loaded. Press the Stop key.	
F-Ptc	21	Motor PTC Over Temperature	The connected motor PTC device has caused the drive to trip	
FAn-F	22	Cooling Fan Fault	Check and if necessary, replace the drive internal cooling fan	
O-HEAL	23	Ambient Temperature too High	The measured temperature around the drive is above the operating limit of the drive. Ensure the drive internal cooling fan is operating Ensure that the required space around the drive as shown in sections 3.5 to 3.9 has been observed, and that the cooling airflow path to and from the drive is not restricted Increase the cooling airflow to the drive Reduce the effective switching frequency setting in parameter P2-24 Reduce the load on the motor / drive	
0-tor9	24	Maximum Torque Limit Exceeded	The output torque limit has exceeded the drive capacity or trip threshold Reduce the motor load, or increase the acceleration time	
U-tor9	25	Output Torque Too Low	Active only when hoist brake control is enabled P2-18 = 8. The torque developed prior to releasing the motor holding brake is below the preset threshold. Contact your local Invertek Sales Partner for further information on using the Optidrive P2 in hoist applications.	
DUL-F	26	Drive output fault	Drive output fault	
SAFE-2	29	STO Error	Hardware Enable circuit error	
Enc-01	30	Encoder Feedback Faults	Encoder communication /data loss	
Enc-02	31	(Only visible when an encoder module is fitted and enabled)	Encoder Speed Error. The error between the measured encoder feedback speed and the Optidrive estimated rotor speed is greater than the pre-set limit allowed.	
Enc-03	32		Incorrect Encoder PPR count set in parameters	
Enc-04	33		Encoder Channel A Fault	
Enc-05	34		Encoder Channel B Fault	
Enc-06	35		Encoder Channels A & B Fault	
ALF-0 I	40		Measured motor stator resistance varies between phases. Ensure the motor is correctly connected and free from faults. Check the windings for correct resistance and balance.	
ALF-02	41		Measured motor stator resistance is too large. Ensure the motor is correctly connected and free from faults. Check that the power rating corresponds to the power rating of the connected drive.	
ALF-03	42	Autotune Failed	Measured motor inductance is too low. Ensure the motor is correctly connected and free from faults.	
ALF-04	43	Autotulie Fulled	Measured motor inductance is too large. Ensure the motor is correctly connected and free from faults. Check that the power rating corresponds to the power rating of the connected drive.	
ALF-05	44		Measured motor parameters are not convergent. Ensure the motor is correctly connected and free from faults. Check that the power rating corresponds to the power rating of the connected drive.	
OUE-Ph	49	Output (Motor) Phase Loss	One of the motor output phases is not connected to the drive.	
5c-t0 I	50	Modbus comms fault	A valid Modbus telegram has not been received within the watchdog time limit set in P5-06 Check the network master / PLC is still operating Check the connection cables Increase the value of P5-06 to a suitable level	
5c-£02	51	CAN Open comms trip	A valid CAN open telegram has not been received within the watchdog time limit set in P5-06 Check the network master / PLC is still operating Check the connection cables Increase the value of P5-06 to a suitable level	
5c-E03	52	Communications Option Module Fault	Internal communication to the inserted Communication Option Module has been lost. Check the module is correctly inserted	
5c-E04	53	IO card comms trip	Internal communication to the inserted Option Module has been lost. Check the module is correctly inserted	

82-P2MAN-IN V1.11
